

d

	tar benign: running into it does not stop the pointer	tar lethal: running into it halts the pointer
a literal write channel (an instruction writes its own operand)	 Z80 soup: open first, then closed, 40 of 40 worlds (300,000 steps; L = 16 and 50)  BFF with a literal and harmless unmatched brackets: open for ever, 12 of 12 worlds; no closed design exists (none among periodic programs to period 10) which of the two happens depends on whether the instruction set offers a closer that the organism can copy along with itself	 BFF with a literal: open first, then extinct, 12 of 12 worlds (12 of 12 also without the wrapping pointer)
no literal write channel	not run	BFF as published: born closed, 28 of 28 worlds that produced life (9 as published, 19 with a wrapping pointer)
